PREFACE

This report, the third in a series of biennial health sciences education reports prepared by the California Postsecondary Education Commission, responds to Section 22712.5 of the Education Code, which calls on the Commission to issue every other year a "Health Sciences Education Plan" containing at least three items:

- (a) A finding, taking into account the Health Manpower Plan issues by the State Department of Health, as to whether health sciences education enrollment levels are adequate to meet the needs in California for health personnel by category and specialty within each category.
- (b) A finding as to the extent to which the sites of health sciences training programs make maximum available use of existing clinical and classroom resources throughout the state.
- (c) Recommendations concerning the establishment of new programs or the elimination of existing programs in health sciences according to findings in subdivisions (a) and (b).

(The complete text of the 1976 legislation authorizing this series of reports appears in Appendix A on pp. 77-79.)

The first report in the series, that of July 1979, entitled A Health Sciences Education Plan for California: 1978-1980 (Commission Report 79-9) addressed all three charges of its statutory mandate at length, and it contained 17 major recommendations, more than half of which concerned health manpower directly as opposed to health sciences education. (These recommendations are reproduced in Appendix B on pp. 81-83.)

The second report in the series, that of January 1981, titled A Report on Health Sciences Education Planning (Commission Report 81-2) emphasized the first of these three charges--that of adequate enrollment levels in the health sciences. But by the time of its publication, the second of the charges, dealing with the utilization of existing clinical and classroom facilities for training purposes, appeared to be increasingly anachronistic--a holdover from the era of rapid program growth when new facilities were urgently needed. In addition, the inadvisability of such a sweeping approach to recommendations as the 17 in the first report was apparent, and hence the second report contained no formal recommendations at all,

despite its reiteration of the Commission's commitment to earlier recommendations.

This third report seeks to fulfill the Commission's responsibility for monitoring the educational preparation of health manpower in light of California's Health Manpower Plan; but in terms of the three charges to the Commission regarding its content, like the second report it deals at greatest length with the first of the three. The bulk of its content consists of findings on the enrollment and output of health sciences programs in California's public and independent institutions of higher education, together with commentary on trends in enrollments and degrees granted that have implications for the size and composition of the State's health manpower pool. Like its predecessor, it deals only tangentially with the second charge regarding the utilization of existing facilities. And while it contains implications for State policy regarding health sciences education, it makes no recommendations "concerning the establishment of new programs or the elimination of existing programs," in keeping with the Commission's general posture in the area of program review, which is to rely instead on the segmental and institutional processes of programmatic self-assessment and evaluation which operate at the institutional and segmental levels and which the Commission seeks to encourage and improve

The organization of this report, like its title and substance, departs somewhat from that of the earlier documents. Following this Preface, its first section reviews the most recent Health Manpower Plan produced by the Division of Health Professions Development in the Office of Statewide Health Planning and Development. Its second section examines the status of key issues identified by the Commission in the two previous reports and focuses on two continuing problems among all of these issues: medical residencies, and attrition in the nursing profession. The third and longest section consists largely of statistical data on enrollments and degree production in California's health sciences programs, with comments on those trends having particular significance for California's health manpower pool in the future.

The data in the third section of the report differ occasionally from those in the previous two reports, due to improvements in data gathering. In the course of assembling data for the first two reports as well as their forerunner document of 1976, Health Manpower Study of Selected Health Professions in California, by John C. Wong (Commission Report 76-11), multiple sources of data were in some instances used for the same table. This practice, in the name of completeness, introduced occasional uncertainties and inaccuracies into the tables. This year, a special effort has been made to refine, correct, and update the data in order to present the most reliable and internally consistent information possible for the

years covered by the Commission's information system--1976 through 1981

These improvements should not be interpreted to mean, however, that the data in this report are completely reliable indicators of enrollments or outputs in every program for every year. In spite of the progress of the Commission's information system, many problems remain in identifying and counting students, assembling and transmitting information about them, and analyzing and displaying institutional and segmental outcome data. At appropriate points in the tables of this report, caveats are included in the text or in notes, and further discussion about the problems of data about student ethnicity can be found on pp. ix-x of the Commission's 1982 Information Digest. Postsecondary Education in California. Subject to the limitations of those caveats, the Commission presents the following findings and conclusions as the best available overview of the status of education in the health sciences in California at this time.

(As part of the process leading to a final report, this draft report will be submitted for review to all interested entities of government and health, including the segments of higher education, the Office of Statewide Health Planning and Development, appropriate professional associations and licensing boards, and other relevant agencies.)

ONE

THE 1981 HEALTH MANPOWER PLAN

In carrying out its responsibility of taking into account the Health Manpower Plan in the development of this report on health sciences education, the Commission has reviewed the 1981 Health Manpower Plan as it has the previous editions of that document. Furthermore, at the request of the authors of the Manpower Plan, the Division of Health Professions Development of the Office of Statewide Health Planning, a staff member of that agency made a presentation on the document at the April 1982 meeting of the Commission.

CONTINUING MANPOWER PROBLEMS

Much of the 1981 Health Manpower Plan is a reiteration of the manpower problems identified in earlier plans, and it is not necessary to review this material in detail. Most of these problems have become perennial in nature, with ongoing State policies and, in some cases, programs having been developed to meet them. They include:

1. The geographic maldistribution of health care personnel in California in the light of aggregate numbers which are entirely adequate, and the resultant detrimental effect on health care delivery in some areas.
2. The need for significantly larger numbers of minority professionals in health fields, together with the need for larger numbers of women in most senior level health occupations.
3. The shortage of nurses willing to work under existing employment conditions in the light of a large and growing pool of licensed nurses.
4. And the need for the State to encourage the development of primary care in the health professions, and to encourage the use of mid-level practitioners when appropriate.

The Commission not only has endorsed the Health Manpower Plan's position on these issues, but in several instances has adopted recommendations on them that predate the position of the Office of Statewide Health Planning and Development.

NEW MANPOWER ISSUES

Three new areas receive extensive treatment in the 1981 Health Manpower Plan. (1) the "pro-competitive" model of health care in the United States; (2) the need for mental health manpower; and (3) the need for geriatric manpower. Each of them warrants review here.

The "Pro-Competitive" Model of Health Care in the United States

The pro-competitive model, in the broadest sense, is the concept that cost containment in medical care can be best assured through the development of more consumer choice among competitive modes of health care, with the consumer paying enough of the cost of health care out-of-pocket to be vitally interested in finding the least expensive mode. Various legislative proposals have been drafted to establish such a system, generally along lines suggested by the health economist Alain Ethoven, but in its purest form such competitive health care would exist with considerably less--rather than more--statutory framework for health care. The State Health Plan might thus be a more appropriate place to explore the concept of marketplace competition than the Health Manpower Plan, but the Manpower Plan relates the concept to manpower planning through its discussion of potential physician surplus as a factor in competition.

Acknowledging that the needs of the State for policy in this area are not clear, the Manpower Plan calls for pilot projects, presumably at the community level, to determine if various kinds of competitive health care delivery systems can make more cost-effective use of health personnel. It also calls for a joint effort among the Division of Health Professions Development of the Office of State-wide Health Planning and Development, the University of California, and the Postsecondary Education Commission to study "in depth the impact on health personnel of the competitive model of health service delivery systems." The Postsecondary Education Commission recognizes the need for State government to explore and understand the economies of health care more fully, and will welcome the opportunity to participate in such an endeavor.

Mental Health Manpower

The Health Manpower Plan's second new area of attention is mental health. It is clear that issues of mental health have often received less attention than those of physical health; indeed, the Commission

is aware of how little it has said about educational programs in mental health in its two earlier biennial health sciences education reports. The Health Manpower Plan has now appropriately devoted considerable attention to the size and nature of mental health activities in California and to the kinds of professional and paraprofessional personnel who work in this field.

General recommendations in the Plan regarding mental health manpower call for greater recruitment of minorities into mental health programs and for more mental health personnel for rural areas--although the Plan admits that "there is no available evidence to conclude that people in low areas with few personnel have a poorer mental health status as a result" (p. 343). Somewhat more specific recommendations call for the State to "initiate" programs to train mid-level practitioners and paraprofessionals in mental health, although the Plan does not discuss the role of mid-level practitioners nor indicate the usefulness that paraprofessionals might bring to mental health growing out of their training as such.

The Commission is concerned with the Plan's use of the term initiate, and its implication that no programs now exist in these areas. Programs do exist, but in some cases special legal problems render them ineffective. One conspicuous example of mid-level mental health practitioners training in California was the joint program of the Berkeley and San Francisco campuses of the University of California which produced graduates with the Doctor of Mental Health degree--this program, however, was discontinued at the end of the 1981-82 year. In addition, the usefulness in mental health situations of nursing clinical specialists or nurse practitioners has been momentarily set back by the Board of Registered Nursing's abandonment of the psychiatric nursing section of the licensing examination, which means that California nurses, unlike their counterparts in other states, will have no certification with respect to psychiatric nursing. Paraprofessionals, as that term is used in the Manpower Plan, are trained in a number of programs listed in the Allied Health portion of the third section of this report. The Commission agrees that in some cases, career pathways can be made clearer and more meaningful for personnel in mental health components of allied health, but concludes that, in general, there is no compelling immediate need for additional programs in this area.

Geriatric Health Care Manpower

Geriatric health care is explored in the Health Manpower Plan in much the same way as is mental health care, with a discussion of the nature of the special needs of this target population and a

review of manpower considerations. Recommendations stress the importance of both team and mid-level care--concepts reviewed favorably in the Commission's 1980 report to the Legislature, The Need for Educational and Research Centers in Geriatric Medicine--as well as the need to improve financing of geriatric care and to assure sensitivity to the special health care needs of the elderly members of minority groups.

Commission Endorsement

Subject to the minor concerns identified above regarding competition and mental health, the Commission generally endorses the findings and recommendations of the 1981 Health Manpower Plan in the three areas covered for the first time in the Plan. It also reiterates its support of the Manpower Plan's general positions on the ongoing problems of attaining better distribution of health personnel and health care, recruiting substantially larger numbers of minorities and women into health professions, resolving the nursing shortage, and expanding the availability of primary care, including expanded use of mid-level practitioners whenever appropriate.

TWO

RECURRING THEMES FROM EARLIER BIENNIAL REPORTS ON HEALTH SCIENCES EDUCATION

As noted in the Preface, the focus and scope of the three documents in this series have varied considerably. The 1978 report was ambitiously comprehensive, attempting to identify a broad array of educational--and even manpower--issues in all five fields specifically included in the statutory charge: medicine, nursing, dentistry, pharmacy, and optometry. The 1981 document was more modest in scope, narrowing its attention to two residual issues from the earlier report--graduate medical education, and the relation of nursing education to the problem of attrition in the nursing profession--and examining two others: (1) the lack of institutional settings and roots for educational programs in nurse midwifery, along with the statutory ambiguity surrounding this field; and (2) the growing need for better information for decision making on public policy matters in health manpower and health sciences education. Both of the residual issues in 1981 remain for extended review in later pages of this report. The two new issues of 1981, although not satisfactorily resolved, need not be reviewed extensively here, although they do deserve mention.

NURSE MIDWIFERY

Nothing has changed during the ensuing two years regarding the lack of programmatic and statutory bases for nurse midwifery, but the Legislature has given attention to several bills clarifying the legal status of nurse midwives free of the hysteria which is created when lay midwifery is included in the discussion. One bill passed, dealing only with licensing fees; another bill, dealing with scope of practice and educational preparation of nurse midwives, came within four votes of passage on the floor of the Senate after passing the Assembly.

DATA FOR POLICY MAKING IN HEALTH MANPOWER AND HEALTH SCIENCES EDUCATION

The disposition of this second issue has been equally inconclusive. Not only does it remain inexplicably difficult to obtain reliable data on the numbers and kinds of people being trained in the health sciences, but there seems to be an equally persistent tendency of

some people to ignore the limitations of such unreliable data. Two recent examples of this latter tendency have been the widespread acceptance in governmental circles of the findings in the summary report of the Graduate Medical Education National Advisory Committee (GMENAC) without reference later to the full report whose data and methodology the Commission questioned in a critique for the Legislature, and the willingness of State manpower planners to continue to advise the Legislature on health sciences education matters using incomplete and inaccurate medical school enrollment data that were derived--in part by extrapolation--from secondary sources. While this issue of data will not be pursued further in this report, it cannot be ignored: Greater effort is needed not only to obtain but to use intelligently better data on the size, composition, and cost of educational activities in the health sciences.

MEDICAL RESIDENCIES

The recurring issue of graduate medical education, along with that of attrition in the nursing profession, also remains unresolved after repeated scrutiny in the earlier reports in this series, but at least several events have taken place which suggest that both direction and momentum have been attained in movement toward what may be mitigation if not resolution of both problems.

The problem of medical residences in California stems in large part from the basic characteristics of graduate medical education and the uniqueness of this form of on-the-job training. Tension is inherent in graduate medical education between the needs of the future for medical manpower, as represented by the resident as a physician-in-training, and the need for current delivery of cost-effective health care, as represented by the resident as a physician member of the house staff of the hospital. Like a number of other forces at work in the development of public policy, this tension need not be undesirable in itself, but in California several sets of additional forces make it particularly complex and confusing for planners in education and health.

The governmental and institutional entities contributing to this tension are diverse. On one side are health manpower planners, led by the Division of Health Professions Development of the Office of Statewide Health Planning and Development, who together with some legislators and their staff have been influential in arguing that the State should restrict the growth of residencies in non-primary-care fields because of the strong possibility of a surplus of such specialists while lacking sufficient numbers of primary care physicians.

On the other side are hospitals--the sponsors of residencies--who have immediate need for low-cost medical staff to deal with the secondary and tertiary care aspects of medicine which occur in that setting--surgery, anesthesiology, radiology, and the like. Since hospitals fund the residency positions out of revenues that ultimately derive from patient care, and since hospital care would likely be more costly without residents, broad social purposes are served by the existence of residencies for health care, as well as by residencies as investments in future manpower.

The fact that a current need for specialists in hospitals may be quite different from a future need for office-based private physicians appears not to have been a serious problem during the period following World War II when residencies expanded and developed rapidly out of the old internship system, simply because it was a period of growth for American medicine in which all additional physicians could be comfortably absorbed. But that growth has stopped, and the State now faces the question of its ability to absorb the output of graduate medical education. Ideally, health planners should address this question by considering both the need for proper balance in future medical manpower and that for immediate cost-effective health care in hospitals. In practice, however, the future effect of today's graduate medical education programs seems to have been given considerably more legislative attention than has the current requirement for low-cost physician care in hospitals.

This attention has now given rise to the development of counter forces which have influenced the original balance struck between present and future needs in dealing with residencies. One such force is the University of California's vital interest in the current supply and mix of residencies, not only because of the usefulness of residents in delivering cost-effective health care in University teaching hospitals, but because of their value as teachers and mentors in undergraduate medical education. The University has argued in recent years that reductions in the number of certain kinds of non-primary-care residencies by the Legislature in the name of a better future mix of specialists can have adverse effects upon the University's ongoing efforts in educating physicians. It has also noted that legislative efforts to affect the future specialty mix of physicians through controls on residencies fails to address the major source of the problem--the two-thirds to three-quarters of new physicians licensed in California each year who have been educated throughout their program, including graduate medical education, in other states and countries.

A complication in this nexus of forces is the desire of some State officials to see the Charles R. Drew Postgraduate Medical School emerge as a semi-autonomous medical education program with substantial State support. In recent years, the Legislature has funded

faculty supervision of Drew residents in a wide variety of specialties, including those non-primary-care fields which the Legislature has pressured the University to reduce throughout the rest of the University medical education program. In this case, the Legislature has accepted the University's argument that a broad mix of residents is necessary in educating physicians at the undergraduate or professional level of medical education and has indicated that special circumstances make this argument operable at Drew which should thus expand its State-assisted non-primary-care residencies, even though elsewhere in the University the number of such residencies should be reduced. If the same ratio of residents to medical students which the Legislature has authorized at Drew were applied to all medical education in the University, the University would need more than 9,100 residents for this purpose instead of the 4,400 residents presently supported for all purposes.

One final complication is the recent State budget crisis, through which \$2 million of support for a number of non-primary-care residencies was deleted from the University's budget in legislation designed to place limitations on Medi-Cal spending. Yet, the same legislation also created serious revenue shortfalls for hospitals that conceivably could result in a greater need to utilize residents in delivering health care rather than reducing such need. This move by the Legislature to cut back on support of non-primary-care residencies as a part of Medi-Cal reductions is the most recent in a series of specific actions taken over the past five years in the general direction of reducing State support of such residencies. Unfortunately, this action jeopardizes the recent progress in sequentially getting better information on the size and nature of University-affiliated residencies, working out understandings between the University and the State on the philosophy and rationale which should guide the development of residency programs, and developing for the first time realistic plans for both short-term and longer-range development of graduate medical education in California. The systematic progress which had been made in defining and providing a rational basis for the State's role in the development of residencies has been impeded. Significantly, the need for establishing such definition and rational foundation for graduate medical education was identified by the Commission as a high priority in its first Health Sciences Education Plan in 1978.

A brief review of the sequence of events of the last five years demonstrates the progress which had been made prior to this recent action.

- In supplemental language to the 1977-78 budget, the Legislature directed the University of California to henceforth provide

annual information on the number and mix of residencies, projected increases and decreases, and a justification for the projected changes. The Legislature also expressed its intent "not to support additional residencies beyond the 1977-78 budgeted total unless the University can document that the specialty with added residencies is in short supply."

- Supplemental language to the 1979-80 budget directed the University to reduce the number of residents in 1980-81 to a level of 12 below the 1979-80 level, with the reductions to occur in non-primary-care fields.
- In the 1980 budget, supplemental language called for an annual report on medical residencies, with the first report to include an explanation of the process by which the University determines that residencies are necessary to its graduate medical education program, the way in which the State's interest in primary care and prevention is taken into account in the development of residencies, the relationship of the University's residency development to projected oversupplies of certain medical specialties, the relationship of residency development to the problem of geographical maldistribution of medical service, and the way in which residencies contribute to undergraduate medical education, graduate medical education in primary care specialties, and research. The University was also directed to add 17 residencies in preventive medicine specialties.
- Other year-to-year adjustments in the number of residencies were called for by the Legislature during this period, most notably in connection with the start-up of the UCLA medical education program at Drew. These adjustments were ultimately worked out satisfactorily through discussion and correspondence among representatives of the Postsecondary Education Commission, the Office of Statewide Health Planning and Development, the Legislative Analyst, the Department of Finance, and the University. This movement toward mutual understanding and acceptance of the University's role in graduate medical education culminated in supplemental language to the 1981-82 budget, calling for the University to develop a five-year plan for medical residencies, and the review of this plan by the Commission and the Office of Statewide Health Planning and Development.

In general, the University has complied with the intent of the Legislature, despite its initial hesitation in implementing the first legislatively mandated reduction in the number of residents:

- The University supplied the annual inventory of residencies until that document was replaced with the annual report on residencies required in the 1980-81 budget language. This latter report and its successor, the five-year plan for residencies, were reviewed by the Commission and the Office of Statewide Health Planning and Development at the request of the Legislature; and the Commission found both documents to be appropriate and useful responses, although the Office of Statewide Health Planning and Development was somewhat less satisfied.
- The Legislature also asked in supplemental budget language for 1981 and 1982 that the University, the Commission, and the Office of Statewide Health Planning and Development review the report of the Graduate Medical Education National Advisory Committee (GMENAC) for its relevance in developing policies toward graduate medical education in California; and all three agencies complied.
- In the meantime, the University on its own produced a series of internal documents which formalized policies toward graduate medical education. In 1979 it published Guidelines for Academic Planning in the Health Sciences in which it adopted the concept of no further expansion of non-primary-care residencies. This document was followed by two similar documents in 1981--Status of Long-Range Planning for Health Sciences Education, and Guidelines for Planning Graduate Medical Education Programs in University of California Schools of Medicine--that bridged the period between the University's statement on philosophies and rationale for graduate medical education in response to the 1980-81 supplemental budget language, and the appearance in 1982 of its Five-Year Plan for Medical Residents 1982-83 Through 1986-87.
- The University published its Five-Year Plan in two sections, the first reflecting what the anticipated changes in residencies might normally be in the absence of any special circumstances, and the second--several months later--reflecting the actual changes for the first year that the University was forced to make because of the budget cuts it had to absorb late in the budgeting cycle for 1982-83 as a part of the severe fiscal crisis.

Shortly after the appearance of the second part of the Five-Year Plan came conference committee adoption of the Medi-Cal reform bill, including as one section, "It is the intent of the Legislature that, due to the oversupply of specialists, the sum of two million dollars (\$2,000,000) which would have been used to fund one-half of the residency positions for physicians not engaged in providing primary care for University of California hospitals during the

1982-83 fiscal year, be removed from the University of California's budget allocation." Those physicians, of course, were house staff or residents, for whom the University had signed contracts earlier in the year. The elimination of this support for 300 non-primary-care residents meant that the University had to find \$2 million from other sources to comply with the contractual obligation--a difficult task in the face of reduced levels of support in every part of the University's budget.

The Commission is concerned with this interrupted progress in the resolution of the ongoing and inherent problem of residency balance. The State's position and the University's position on this matter should now be reconciled. Because of the recent budget actions, attainment of the Commission's goal of mutually acceptable role definition and rationale for graduate medical education in California, may be more difficult than before, but it is essential that efforts continue toward this goal.

SUPPLY OF NURSES

Like the tensions in graduate medical education, the cycle of meeting nurse manpower needs through nursing education is characterized by an inherent incompatibility between two strong forces at work, each of which is understandable and socially acceptable: the professional expectations of nurses on the one hand, and, on the other, society's expectations for utilizing nursing personnel. The recent shortage of nurses serves well to illustrate this incompatibility.

Considerable evidence indicates that basic dissatisfaction with working conditions is the major reason why large numbers of licensed nurses have dropped out of the work force in recent years and that salary levels are not among the primary reasons for this dissatisfaction. There seems to be a widespread feeling among these dissatisfied nurses that nursing is not treated by hospitals and physicians as a profession with the right to control its own practice. Such a situation, coupled with difficult working conditions and little opportunity for higher forms of professional recognition, including salaries commensurate with those of other health professionals, erodes the morale of nurses and causes them to leave the profession.

The resultant shortage of nurses has been addressed in a number of ways by hospitals, none of which has yet resolved the problem. From the hospitals' point of view, and indeed from society's as

well, the professional satisfaction of nurses is not a primary concern; it is important only insofar as it contributes to keeping them on the job and effective in their performance. Also, hospital administrators perceive that meeting nurses' professional expectations would lead to higher health care costs, since nursing care represents a major proportion of hospital operating costs. As a result, most responses to the nursing shortage in recent years by hospitals, other agencies, and society at large have been relatively short-sighted efforts to recruit nurses whose professional expectations are low but whose need for a modest monthly pay check is high. This approach has been epitomized by an unfortunate sequence of events: (1) an increased failure rate of marginally trained nurses on the State licensing examination, (2) State pressure on the Board of Registered Nursing to adjust the licensing standards downward, and (3) creation of new forms of hospital-based apprenticeships with minimum higher education affiliation to train nurses in on-the-job settings. The net effect of this approach has been to ignore the apparent causes of the nurse work-stoppage and to respond with efforts that tend to deprofessionalize--and perhaps demoralize--nursing even further.

It is not clear what would happen if these policies were to continue through a lengthy period of nurse shortage. What has now happened, and what may now provide an opportunity to avoid further polarizing of the parties in this struggle, is an end--at least temporarily--to the nurse shortage. For several reasons, late 1982 was characterized by a tight employment market for nurses: difficult economic times sent nurses back to work, while low patient censuses in hospitals around the State and prospects of much lower levels of care under significant Medi-Cal cutbacks by the federal and State government produced layoffs for employed nurses, and difficulty in finding jobs for new graduates. These factors have been responsible for achieving what millions of dollars spent on recruiting and retention were unable to do--stabilizing the nursing work force.

The Commission believes that the State should quickly capitalize on the several immediate advantages that have developed from this situation:

- First, this stabilization of nursing manpower buys time for resolving the larger problem of nurses' need for professionalism versus society's need for nursing manpower. Crash programs are not needed to meet shortages; instead, the record can be examined of such programs as the California Work-Site Education and Training Act (CWETA), which has been training hospital-based nurse assistants and licensed vocational nurses, respectively to

become licensed vocational nurses and registered nurses at annual State costs ranging between \$1,207 and \$7,355 per new licensed vocational nurse and \$2,027 to \$7,355 per new registered nurse. Progress can also be made toward resolving the perplexing question of level and content for basic professional preparation in nursing. Parallel questions can also be explored: can professional status be achieved in a field with extensive built-in career ladders, or is the need for professional status for nursing any different from that of professional status for physicians in relationship to the public interest?

- Second and similarly, the State can back away from the polarization created by the Board of Registered Nursing's insistence that standards be lowered to permit foreign-trained nurses and certain ethnic groups to pass the license examination in greater numbers. The whole question of nurse licensure can be explored dispassionately, including the rationale, standards, and procedures used by the Board of Registered Nursing to shape nursing curricula, design and administer licensing examinations, and credential nurses. Such a review can address two emerging realities: that many foreign nurse training programs are simply sub-standard for California's needs and that competence in oral and written English is essential for a nurse in California, whether on the licensing examination or in carrying out physician orders in the hospital. This review may also speak to the question of whether certain ethnic minorities have been short-changed by being steered largely into the lowest level of nurse preparation--apprenticeships and career ladders--rather than by aggressively encouraging and expecting them to seek baccalaureate preparation.

While this period of stable employment may be an opportune time to re-examine the training, licensing, and utilization of nursing personnel free of the immediate pressures to produce more nurses, it is not a time for complacency or for assuming that the basic problems of keeping nurses on the job have been resolved. Improving economic conditions could change the situation quickly and drastically, sending nurses back to the stance they have taken in recent years. Conceivably the profession could consolidate its position into one calling for expanded professional recognition in both the level of authority exercised and salary received. It is also possible that backlashes could develop, for example, from the growing physician population, some of whom view the aspirations of nurses for greater professional autonomy as threatening their own professional role in the hierarchy of hospital personnel.

During the past several years, progress has been made in dialogue between the nursing profession and the hospital industry in providing a better philosophical rationale for the hiring, utilization,

and retention of nurses. The Commission hopes that the present period of employment stability will provide an opportunity to continue this dialogue, particularly with respect to the quality of patient care and the quality of life for the hospital nurse. Key elements in the improvement of both kinds of quality include the mutual acceptance of differentiated competencies and responsibilities at various levels of nursing experience and education and greater input from nurses into the decision making processes of hospitals--from patient care to broad administrative plans and policies. For its part of this cooperative effort, the nursing profession will need to continue to work toward a unification of the profession in support of definitions and goals acceptable to its membership and salable to the health establishment and society.

THREE

HEALTH SCIENCES ENROLLMENT AND DEGREES CONFERRED IN CALIFORNIA INSTITUTIONS OF HIGHER EDUCATION

This third section contains the core of the Commission's report on the status of health sciences education in California: detailed information on enrollments and on the number of degrees conferred in the various health sciences disciplines and programs in institutions of higher education within the State. Most data comparisons begin with the year 1975-76, when the Commission's information system first began to collect data by various demographic characteristics; although earlier enrollment and degree data is occasionally shown for comparing the overall size of programs, but no generalizations can be drawn about the internal mix of students or graduates before that year.

The two demographic characteristics of students highlighted in the following data are generally ethnicity and sex. Because data on ethnicity are gathered in slightly different ways from public and independent institutions, as well as from graduate or professional-level and baccalaureate-level programs, they are not completely comparable in all cases, and caveats are necessary from place to place to emphasize this limitation of the data.

For example, in medicine, dentistry, pharmacy, and optometry, programs in the public sector report student ethnicity in nine categories, while those in the independent sector report in only six categories. This incongruity results in the need to combine and pro-rate the extra categories in the public sector into the smaller group of categories, with resultant uncertainty and inaccuracy.

Similarly, in nursing at the baccalaureate level, both sex and ethnicity are reported for public institutions, but only sex is available for independent institutions. At the associate degree level, only sex is available for both public and independent institutions.

In allied health, where data collection and analysis began only in 1978-79, data comparability problems are similar to those of nursing but are compounded by the fact that similar programs sometimes have dissimilar names, resulting in some programs that should be counted actually being overlooked.

SIZE OF PROGRAMS

Table 1, which contains a broad overview of the size of educational programs in the various health fields by enrollment and output, illustrates the difficulty of getting an accurate comparison of all programs even for one year. Several categories show no figures for a particular segment, with a dash indicating that the program does not exist at that level in that segment. But other sections of the table contain NC (not collected) notations, meaning that data for them are not collected by the Commission's information system or by the Higher Education General Information Survey (HEGIS) in this form or at this level of detail. Where zeroes are shown in the table, programs do exist and are reported, but are not yet fully operational.

In all cases, the programs reported in Table 1 are the basic professional training programs which prepare graduates for practice in the professions, either through licensure or through the standard educational attainment necessary for practice. Higher or lower level programs are not included. For nursing, several levels of preparation for licensure are shown, including even the master's degree which is now the level of the professional preparation program in nursing at the University of California, San Francisco; only that single graduate program is shown in the table. For most allied health fields, the baccalaureate level is shown, although in public health and clinical social work the professional master's degree program is also included in the totals.

CHANGES IN STUDENT CHARACTERISTICS

Table 2 is also designed to display comparatively the basic demographic characteristics of the students enrolled in and graduating from the various programs over a period of time. Basically, all figures in the table are the percentages that each ethnic or gender group represented of the total enrollment or output of professional training programs for given years during a six- or three-year time span.

Three caveats require emphasis regarding this table:

1. Ethnic data exist for both public and independent institutions in medicine, dentistry, pharmacy, and optometry, and for the independent institutions which have the only programs in podiatry, osteopathy, and chiropractic. In nursing and allied health fields, however, ethnic data exist only for public institutions.
2. Reporting spans differ in the two sections of the table, with data on medicine through optometry on page 19 reflecting data from 1976 through the fall enrollment of 1981, while data in the second portion of the table on pp. 20-21 cover only the period from the spring quarter of 1979 through fall enrollment of 1981.
3. Conclusions should be drawn cautiously from the table inasmuch as the percentages reflect known ethnicity. The voluntary self-identification by students of their ethnicity virtually assures incompleteness of the data. In some fields, particularly in nursing and the allied health fields, unknown ethnicity may be as high as one-fourth of the total. In a few fields, such as radiologic technology, the total numbers are so small as to make ethnic percentages potentially misleading.

No indication of total size or shifts in total size of the programs appears in Table 2; instead, such data are available in the remaining portions of this report, which are devoted to data and brief interpretations of data on each of the individual health sciences disciplines that the Commission monitors for the purposes of its series of health sciences education reports.

MEDICINE

As of 1981, total enrollment in medical schools in California had leveled off and even dipped for the first time, reflecting an enrollment decline of about 2 percent in the three independent medical schools, which more than offset an increase of about 1 percent in the five University of California medical schools (Table M-1, below).

Total output of graduates, which peaked in 1980, has also dipped, with the University's medical schools graduating almost 6 percent fewer students in 1981 than in the peak year. In the independent institutions, however, output continues to grow, with 1981 graduations up more than 5 percent over 1980 and 3 percent over the previous high year for that sector (Table M-2).

Progress has been made in enrolling additional numbers of medical students from underrepresented groups, but these gains have been slow. The percentage of women in the University's medical school enrollment has gone from 25.4 to 32.2 in the five-year reporting period, while in the independent institutions the increase has been from 22.1 to 25.9 percent (Table M-3). Blacks constituted 6.3 percent of the University's medical school enrollment in 1976 but only 6.0 percent in 1981, although the proportion of Hispanic enrollment increased from 9.5 to 10.2 percent during this time. In the independent sector, Black enrollment declined from 5.3 to 5.0 percent of the total, while Hispanic enrollment rose from 4.8 to 6.4 percent.

Source Analytical Studies, California Postsecondary Education Commission

Graduation trends have generally paralleled those of enrollments. The percentage of women in graduating classes in medicine grew from 21.9 to 28.2 in the University medical schools during the five years, and went from 17.0 to 21.3 in the independent institutions during the same time (Table M-4). For Blacks, the same number (24) graduated from the University's medical schools in 1976 as in 1981, but the male-to-female ratio of this group reversed from roughly 2:1 to 1:2 during this time. The percentage of the graduating class that was Black went from 4.4 to 4.3 during this period. For Hispanics in the University's medical schools, greater growth occurred, with their number of graduates going from 26 to 44, and their proportion of the graduating class rising from 4.8 to 7.9 percent. In the independent institutions, the output of Black graduates rose from 9 to 13, and their proportion in the graduating class increased from 2.7 to 3.4 percent. The change for Hispanics was similar: from 13 to 17 in number, and from 4.0 to 4.4 percent in proportion.

NURSING

Enrollment

Table N-1 shows that enrollment in hospital nursing programs is remarkably resilient, with 1981 registering the highest enrollment in the State's four remaining hospital programs since 1975.

Table N-2 shows enrollment in Community College nursing programs continuing to climb, with the increase of 1981 over 1980 about 9.4 percent--considerably higher than their growth rates in previous recent years.

Source Board of Registered Nursing

Table N-3 indicates that enrollment in associate degree nursing programs offered by four-year institutions remains essentially at the level of eight years ago, although it has been considerably higher in the meantime.

Table N-4 reveals conflicting trends in baccalaureate-level nursing enrollments. At the University of California, enrollments are down substantially, reflecting the phasing out of the generic B.S. program in nursing at the San Francisco campus. In the State University, enrollments are up, but these particular enrollments have been characterized for years by fluctuations, reflecting year-to-year and campus-to-campus changes in the way students are counted, particularly at the lower division level. Total enrollment in the baccalaureate programs in the independent sector is relatively trendless for the last five years, although 1979 and 1980 did show somewhat larger totals than 1978 and 1981.

Source: For public institutions HEGIS, UC Statistical Summary, CSU Statistical Reports
For independent institutions HEGIS, Board of Registered Nursing, direct institution response.

Table N-5 points to considerable variation in enrollment in B.S. programs for previously licensed nurses during recent years, reflecting the part-timeness of students who may "stop out" from time to time. After initial rapid growth, the size of these programs may now be stabilizing.

Table N-6 displays fall nursing enrollment by sex and ethnicity for 1976-81. This table displays ethnicity in nine categories, unlike similar tables for medicine, dentistry, pharmacy, and optometry, in which Filipino enrollment for public institutions is combined into the Asian category and the "No Response" and "Other" totals are pro-rated into known ethnic enrollment to make their columns comparable to those for independent institutions which report ethnic data in the six-category format of the Higher Education General Information Survey (HEGIS).

While total baccalaureate-level nursing enrollment in the public segments increased by 32.3 percent during the five years, Table N-6 shows that enrollment of underrepresented minorities underwent even greater change but followed no consistent pattern. Black enrollment actually declined by 38.7 percent, while Hispanic enrollment grew 57.4 percent. In terms of the proportion of total enrollment, Blacks dropped from 7.5 percent in 1976 to 4.4 percent in 1981, while Hispanics increased from 4.6 percent to 5.4 percent. It should be noted, however, that a fairly high proportion of nursing enrollment (10.8% in 1976 and 16.0% in 1981) was in the "No Response" or "Other" categories, and additional minority enrollment may be hidden within these categories. In the University of California, enrollment of both underrepresented minorities declined both numerically and proportionately.

Degree Production

Table N-7 indicates that output of the four remaining hospital diploma programs is higher than it was eight years ago, and is the second highest since that time.

Table N-8 shows that output of Community College nursing programs has resumed its upward trend after leveling off for two years. Several new programs are contributing to this growth.

Source Board of Registered Nursing

Table N-9 reveals that output of non-Community-College associate degree programs has been fairly level for several years after peaking in the late 1970s.

Table N-10 demonstrates that the output of baccalaureate-level programs continues to dip in the State University as well as in independent institutions. This trend, along with lower enrollment from budget cuts in the nursing schools of the University of California does not augur well for long-term resolution of periodic nursing shortages in California or toward the related goal of enhancement of the professional standing of nursing.

Table N-11 indicates that the number of B.S. degrees conferred to previously licensed nurses is holding up reasonably well, reflecting the continued need for such programs for the growing population of associate degree nurses.

Table N-12 shows that total output of public baccalaureate programs in nursing continues to fall. By 1981, it was down about 25 percent from the all-time high reached in 1977-78. On some California State University campuses, the number of students graduating varies widely from year to year which is hard to explain in professional programs which generally are regarded as having a fixed number of "seats" available.

Efforts at attracting and retaining additional numbers of underrepresented minorities into nursing are generally disappointing. The percentage of nursing graduates who are Black declined from 7.7 to 3.7 over the five-year period, while the actual number fell from 92 to 40. For Hispanics the percentage declined from 4.6 to 3.8, with the number dropping from 55 to 41. In contrast, the output of males--the underrepresented sex in nursing--increased proportionately from 5.8 percent of the total to 8.3 percent, and numerically from 70 to 91.

Table N-13 indicates that the output of generic nursing programs in independent institutions dipped slightly from the record levels of 1979-80. Virtually all of these programs are characterized by fairly stable output levels.

Table N-14 reveals that the output of graduate degrees in nursing appears to be in a long-range uptrend, particularly in the California State University. The University of California remains the primary supplier of graduate level nurses in this state, but no clear trends are apparent in its output of master's and doctoral degree recipients in nursing.

DENTISTRY

In the field of dentistry, enrollment has begun to dip nationally, but this trend has not yet shown up in California (Table D-1). However, the output of graduates from the five dental schools in California dipped in 1980-81 from the record high of 1979-80, as Table D-2 reveals.

In dental education, affirmative action appears to have produced reasonably good results, particularly at the University of California, as Tables D-3 and D-4 show. The percentage of graduates of the University's dental schools who are Black has risen from 4.6 percent to 10.2 percent between 1976 and 1981, comparing favorably to the 1980 percentage of 7.5 for Blacks in the California population as a whole and 4.6 percent of the eligibility pool of 1981 college graduates in California. For Hispanics, the results have also been gratifying with the percentage of the dental graduates going from 10.3 to 10.8 during the five-year period, compared to the 1980 proportion of the population of 19.2 percent and 6.2 percent of the recent college graduate eligibility pool. In the three independent dental schools, the percentage of graduates who are Black declined from 2.6 to 1.4 during the same period, and the proportion of Hispanic graduates declined from 5.1 to 3.7 percent.

PHARMACY

Enrollment in the four pharmacy programs in the fall of 1981 was the lowest since 1974 (Table P-1). In the University of California, Blacks represented 7.3 percent of the pharmacy enrollment in both 1976 and 1981, while Hispanics increased from 4.9 to 5.6 percent (Table P-2, p. 48). In the independent institutions, Black enrollment in pharmacy rose from 2.0 to 4.6 percent during this period, and Hispanic enrollment increased from 2.1 to 5.0 percent.

Over the last five years, output of graduates was up sharply at the University of California, San Francisco, but down slightly in the independent institutions, with the total output of pharmacists in all programs in 1981 reaching an all-time high of 443 (Table P-3, p. 48).

The number of underrepresented minorities graduating from the School of Pharmacy at the University of California, San Francisco, has gone up over the last five years, with Blacks showing the greatest increase, from zero percent of the graduating class in 1976 to 8.0 percent in 1981 (Table P-4, p. 49). Hispanics have increased from 3.3 to 5.3 percent in the graduating class during the same period. In the independent institutions, Blacks represented 1.2 percent of the graduating class in 1976 and 2.7 percent five years later, while Hispanics increased from 0.9 to 3.9 percent.

OPTOMETRY

Statewide enrollment in optometry has increased only slightly over 1976, but nevertheless stood at an all-time high of 670 for the fall of 1981 in the two programs in California (Table O-1, below). The proportion of Blacks enrolled in the School of Optometry at the University of California, Berkeley, has dropped from 4.0 to 1.5 percent during the past five years, while the proportion of Hispanics has increased from 5.1 to 5.9 percent (Table O-2). In the Southern California College of Optometry, Black enrollment was 0.5 percent of the total in 1976 and 1.8 percent in 1981, while Hispanic enrollment rose from 2.8 percent in 1976 to 5.0 percent in 1981.

In contrast to increased enrollments in optometry, the output of graduates has dipped from its all-time high in 1978-79 (Table O-3). Output of underrepresented minorities in optometry has generally shown no growth from the low levels existing five years ago. In the University of California, Berkeley program the percentage of Blacks in the graduating class has declined from 3.3 to 1.7 percent, while that of Hispanics dropped from 3.4 to 1.7 percent. At the Southern California College of Optometry, no Blacks graduated in either year (and only two graduated over the entire six-year reporting span), and Hispanics constituted 3.2 and 3.3 percent, respectively, of the graduating classes of 1976 and 1981.

PODIATRY

The three years of data on podiatry provide only a limited basis for generalizing about enrollment or degree trends, let alone changes in the demographic characteristics of students and graduates. Nonetheless, Table PO-1 shows that underrepresented groups have not been drawn to this profession in large numbers. In enrollment, Blacks and Hispanics each represented only 1.0 percent of the total in 1979; by 1981 the respective proportions were 1.8 and 2.3 percent. Women constituted 14.4 percent of podiatry enrollment in 1979, and 15.1 percent two years later.

Ratios for ethnic and women graduates show no growth, with Blacks remaining at 1.1 percent of the total number of graduates over the reporting span, while Hispanics dropped from 2.1 to 1.1 percent and women declined from 9.6 to 8.4 percent (Table PO-2).

OSTEOPATHY

The only program in osteopathy in California had not yet graduated its first class by the fall of 1981. Its enrollment of underrepresented groups has shown only modest change, with Blacks going from 1.1 to 1.7 percent of the total over the three years, Hispanics increasing from 1.1 to 1.3 percent, and women growing from 15.4 to 20.8 percent (Table OS-1).

ALLIED HEALTH

Tables AH-1 through AH-6 on pp 54-73 depict trends in enrollments, degrees conferred, and program completions in the several allied health fields. In these fields, problems of data completeness and interpretation are particularly severe, leading to a need for caution in drawing extensive conclusions about trends from the tables.

FOUR

SUMMARY

In terms of the three specific findings that the Legislature has asked the Commission to incorporate into this report and others in this series, it is possible to conclude that, for the immediate future:

1. Enrollment levels seem to be adequate to meet the need for health personnel in every category, although little attention has been devoted by manpower planners to needs in fields other than the original five mentioned in statute--medicine, nursing, dentistry, pharmacy, optometry.
2. Although Commission staff has not conducted a full-scale utilization study, there is no indication of a need for additional classroom and clinical resources throughout the State for health sciences education.
3. No circumstances exist that call for the Commission to initiate recommendations regarding either the establishment or the elimination of any existing program in the health sciences, apart from those developed in the ongoing process of program approval and review conducted cooperatively with the public segments of California higher education.

Notwithstanding these findings, many challenges remain in planning for health sciences education, among the most pressing of which is funding for this form of education during a period of enormous pressure on State fiscal resources. Several serious problems identified in the first of these Commission reports still remain unresolved, including the issues discussed above of data for policy making, medical residencies, and nursing supply. But the Commission believes that the kind of cooperative efforts among various entities called for in that document--making use of reliable data, constructive dialogue, and commitment tempered with flexibility--have resulted in real progress toward the identification and resolution of some of the most difficult questions. There is no reason to believe that 1983-1984 will see any diminution in the need for these joint efforts or in the progress attained through them

APPENDIX A

Assembly Bill No. 1748

[Approved by Governor August 28, 1976. Filed with
Secretary of State August 27, 1976.]

CHAPTER 600

An act to add Sections 22712.5, 22712.6, and 22712.7 to the Education Code, and to add Article 19 (commencing with Section 42994) to Chapter 2 of Part 1 of Division 1 of the Health and Safety Code, relating to health services.

LEGISLATIVE COUNSEL'S DIGEST

AB 1748, Duffy. Health manpower planning and education.

Existing law provides for a state medical contract program to provide aid for education and training in the area of primary care family physicians' services and provides for a Health Manpower Policy Commission with specified duties in such connection.

The bill would require the State Department of Health to prepare a Health Manpower Plan containing specified elements for California. The bill would require the State Department of Health to issue an updated Health Manpower Plan to the Legislature, Governor, and the California Postsecondary Education Commission on or before September 1, 1977, and biennially thereafter. The bill would require the California Postsecondary Education Commission to issue a Health Sciences Education Plan, based on the Health Manpower Plan issued by the state department, and to issue an updated Health Sciences Education Plan to the Legislature and the Governor on or before March 1, 1978, and biennially thereafter.

The people of the State of California do enact as follows:

SECTION 1. Section 22712.5 is added to the Education Code, to read:

22712.5. The commission shall issue a Health Sciences Education Plan which shall take into account the Health Manpower Plan issued by the State Department of Health pursuant to Section 42996 of the Health and Safety Code.

SEC. 2. Section 22712.6 is added to the Education Code, to read:

22712.6. The Health Sciences Education Plan shall consist of at least the following elements:

(a) A finding, taking into account the findings of the Health Manpower Plan issued by the State Department of Health, as to whether health sciences education enrollment levels are adequate to

meet the needs in California for health personnel, by category and specialty within each category.

(b) A finding as to the extent to which the sites of health sciences training programs make maximum available use of existing clinical and classroom resources throughout the state

(c) Recommendations concerning the establishment of new programs or the elimination of existing programs in health sciences according to findings in subdivisions (a) and (b)

SEC. 3. Section 22712.7 is added to the Education Code to read 22712.7. The commission shall issue an updated Health Sciences Education Plan and recommendations to the Legislature and the Governor on or before March 1, 1978, and on or before March 1 of every even-numbered calendar year thereafter.

SEC. 4. Article 19 (commencing with Section 42994) is added to Chapter 2 of Part 1 of Division 1 of the Health and Safety Code, to read:

Article 19 Health Manpower Planning

42994. The state department shall prepare a Health Manpower Plan for California. The plan shall consist of at least the following elements.

(a) The establishment of appropriate standards for determining the adequacy of supply in California of at least each of the following categories of health personnel: physicians, midlevel medical practitioners (physician's assistants and nurse practitioners), nurses, dentists, midlevel dental practitioners (dental nurses and dental hygienists), optometrists, optometry assistants, pharmacists, and pharmacy technicians.

(b) A determination of appropriate standards for the adequacy of supply of the categories in subdivision (a) shall be made by taking into account all of the following: current levels of demand for health services in California; the capacity of each category of personnel in subdivision (a) to provide health services, the extent to which midlevel practitioners and assistants can substitute their services for those of other personnel; the likely impact of the implementation of a national health insurance program on the demand for health services in California, professionally developed standards for the adequacy of the supply of health personnel, and assumptions concerning the future organization of health care services in California.

(c) A determination of the adequacy of the current and future supply of health personnel by category in subdivision (a) taking into account the sources of supply for such personnel in California, the magnitude of immigration of personnel to California, and the likelihood of such immigration continuing.

(d) A determination of the adequacy of the supply of specialties within each category of health personnel in subdivision (a). Such determination shall be made, based upon standards of appropriate supply to specialty developed, in accordance with subdivision (b).

(e) Recommendations concerning changes in health manpower policies, licensing statutes, and programs needed to meet the state's need for health personnel

429.95. The state department shall consult with the Health Manpower Policy Commission, health systems agencies, and other appropriate organizations in the preparation of this plan

429.96. The state department shall issue an updated Health Manpower Plan and recommendations to the California Postsecondary Education Commission, the Legislature, and the Governor on or before September 1, 1977, and on or before September 1 of each odd-numbered calendar year thereafter

APPENDIX B

Recommendations from A Health Sciences Education Plan for California: 1978-80 (Commission Report 79-9), pp. iv-vi

Medical Education

1. Because of the large and growing number of physicians now practicing or receiving graduate medical education in the State, no additional medical schools or sub-campus of medical schools should be implemented or phased-in in California until the rate of in-migration drops markedly. During this time, existing and currently planned two-year programs should not be expanded beyond two-year status.
2. The State should determine the mode and degree of State influence on medical education programs, particularly residencies, which would achieve the most beneficial results in effecting desired distribution of medical specialties and optimum utilization of medical education as a means of providing health care in underserved areas.
3. The health manpower and health science education planners of the State should develop standards for assessing the adequacy of the total health care which is available to urban and rural Californians, reflecting normal patterns of mobility but taking into account the barriers--cultural, linguistic, economic, and psychological--which may affect the utilization of existing health care resources.
4. The State should provide for the certification of nurse practitioners and should further define this profession and the scope of its practice. The educational and experiential requirements for certification should be established at a standardized professional level, but should provide for a variety of paths to the attainment of those requirements.
5. The State should encourage, through appropriate means, the recruitment of medical students and residents from diverse backgrounds, cultures, and languages, and should encourage, through the medical education programs it supports, the development of sensitivity on the part of physicians to the needs of people as individuals and as members of diverse cultures and groups.

Nursing Education

1. The Postsecondary Education Commission, together with the Division of Health Professions Development in the Office of Statewide Health Planning and Development, should jointly establish a task force to make a differentiated assessment of statewide nursing-care needs and manpower resources. This group should be made up of nursing educators, health planners, hospital spokespersons, legislative staff, representatives of licensure boards and professional associations, working nurses, et al. The task force should explore ways of determining the supply of and demand for nurses, including specialists; resolve problems in the education, employment, and retention of the proper number and types of nurses; and assist various agencies and organizations to work together toward fuller utilization of nursing manpower resources.
2. In order to achieve better coordination and articulation, the two boards now licensing nurses--the Board of Registered Nursing and the Board of Vocational Nurse and Psychiatric Technician Examiners--should be combined into a single board with responsibilities for all licensure of patient-care personnel.

Dental Education

1. The State should clarify and codify the scope of practice of extended-function dental auxiliaries, and should provide educational programs to prepare Californians for these paraprofessional fields
2. Greater use should be made of expanded role dental auxiliaries, particularly in meeting dental needs in underserved areas.
3. Additional minority students should be recruited for careers as dental auxiliaries as a means of facilitating community screening and peer counseling which will provide assistance and support to people in underserved areas who need further dental care.

Pharmaceutical Education

1. The State should provide in statute and regulation for the delineation of function between a professional pharmacist and a pharmacy technician, and should provide appropriate educational programs in each field, taking into account the variety of roles which pharmacists may fill, ranging from traditional retail dispensing of drugs to the delivery of primary health care.

Optometric Education

1. The State should include optometry in the AB 1503 experimental health manpower programs in order to explore possible new roles for optometrists in primary health care, and for optometric technicians in-patient care.
2. Future health manpower plans prepared by the Office of Statewide Health Planning and Development should investigate the overlapping responsibilities of optometrists and ophthalmologists in providing vision care, and should recommend public policies with respect to the utilization of each kind of vision specialist.

Equal Educational Opportunity

1. California institutions should continue outreach, recruiting, and admissions programs to increase the number of minority and women undergraduates as a means of increasing the numbers eligible for programs in the health sciences.
2. Monitoring of educational opportunities in the health professions should be a part of any ongoing monitoring of affirmative action activities by segmental headquarters and such agencies as the California Postsecondary Education Commission. As a part of such monitoring, those special State and federal programs presently operating to increase enrollment of ethnic minorities and women in the health sciences should be evaluated by January 1, 1981, to determine their effectiveness.
3. California institutions should continue to recruit and admit additional, qualified ethnic minorities and women in the health sciences to offset the historic underrepresentation of these groups. Women, as a group, are underrepresented in proportion to their numbers as college graduates, as well as their numbers in the total population. They should be given special priority in these recruiting and admission efforts.
4. All entities of State government which support, govern, or administer education, from the Legislature to local campuses and public school systems, should increase their efforts to identify and overcome those barriers which have prevented minorities and women from participating fully in professional education in the health sciences. Such efforts should be assigned high priority in the allocation of public resources of time and money.

CALIFORNIA POSTSECONDARY EDUCATION COMMISSION

THE California Postsecondary Education Commission is a citizen board established in 1974 by the Legislature and Governor to coordinate the efforts of California's colleges and universities and to provide independent, non-partisan policy analysis and recommendations to the Governor and Legislature.

Members of the Commission

The Commission consists of 17 members. Nine represent the general public, with three each appointed for six-year terms by the Governor, the Senate Rules Committee, and the Speaker of the Assembly. Six others represent the major segments of postsecondary education in California. Two student members are appointed by the Governor.

As of June 1995, the Commissioners representing the general public are:

Henry Der, San Francisco, *Chair*
Guillermo Rodriguez, Jr., San Francisco, *Vice Chair*
Elaine Alquist, Santa Clara
Mim Andelson, Los Angeles
C. Thomas Dean, Long Beach
Jeffrey I. Marston, San Diego
Melinda G. Wilson, Torrance
Linda J. Wong, Los Angeles
Ellen F. Wright, Saratoga

Representatives of the segments are

Roy T. Brophy, Fair Oaks; appointed by the Regents of the University of California;
Yvonne W. Larsen, San Diego; appointed by the California State Board of Education;
Alice Petrossian, Glendale; appointed by the Board of Governors of the California Community Colleges,
Ted J. Saenger, San Francisco, appointed by the Trustees of the California State University;
Kyhl Smeby, Pasadena, appointed by the Governor to represent California's independent colleges and universities, and
Frank R. Martinez, San Luis Obispo, appointed by the Council for Private Postsecondary and Vocational Education.

The two student representatives are:
Stephen Leshner, Meadow Vista
Beverly A. Sandeen, Costa Mesa

Functions of the Commission

The Commission is charged by the Legislature and Governor to "assure the effective utilization of public postsecondary education resources, thereby eliminating waste and unnecessary duplication, and to promote diversity, innovation, and responsiveness to student and societal needs."

To this end, the Commission conducts independent reviews of matters affecting the 2,600 institutions of postsecondary education in California, including community colleges, four-year colleges, universities, and professional and occupational schools.

As an advisory body to the Legislature and Governor, the Commission does not govern or administer any institutions, nor does it approve, authorize, or accredit any of them. Instead, it performs its specific duties of planning, evaluation, and coordination by cooperating with other State agencies and non-governmental groups that perform those other governing, administrative, and assessment functions.

Operation of the Commission

The Commission holds regular meetings throughout the year at which it debates and takes action on staff studies and takes positions on proposed legislation affecting education beyond the high school in California. By law, its meetings are open to the public. Requests to speak at a meeting may be made by writing the Commission in advance or by submitting a request before the start of the meeting.

The Commission's day-to-day work is carried out by its staff in Sacramento, under the guidance of its executive director, Warren Halsey Fox, Ph.D., who is appointed by the Commission.

Further information about the Commission and its publications may be obtained from the Commission offices at 1303 J Street, Suite 500, Sacramento, California 95814-2938, telephone (916) 445-7933.
